

CHES COACH READY™

CHES COACH READY™

BONUS 3 OF 5

Calculation & Mental Endurance Vault™

Full programs covering calculation, visualization, concentration, and mental resistance.

Welcome

What This Bonus Delivers

Module 4 — *Calculation, Focus & Mental Preparation*TM — gives you the framework, the vocabulary, and the individual session blueprints you need to teach these skills. But between that module and your next coaching session sits a gap every serious coach knows well: **where do I find a complete, ready-to-run multi-week program I can hand a student and actually execute from start to finish?**

This vault closes that gap. Every program inside is structured for immediate assignment — real weekly targets, real session content, real time allocations. You don't need to engineer a training arc on the fly. You select the program that fits the student, hand it over, and coach it.

The Problem

Coaches have frameworks but lack pre-built multi-week programs ready to assign without additional prep work.

The Solution

Six complete programs spanning calculation speed, visualization, blindfold training, concentration, and tournament endurance.

The Result

Students receive structured, progressive training. Coaches maintain authority and save hours of curriculum design.

*Bonus 3 of 5 — Chess Coach Ready*TM / *Calculation & Mental Endurance Vault*TM

How to Use This Vault

Working Alongside Module 4

This vault is not a standalone curriculum — it is the operational layer that sits on top of Module 4. Every program here draws its principles, terminology, and pedagogical sequence from that module. Before assigning any program in this vault, ensure you have covered the relevant Module 4 concepts with your student, or plan to introduce them concurrently during Week 1.

1 Read Module 4 First

Familiarize yourself with the calculation and mental training principles before deploying any vault program. The programs here assume you understand the "why" behind each exercise type.

2 Select the Right Program

Use the Program Selection Guide on Pages 22–23 to match your student's specific weakness to the correct vault program. Don't assign by level alone — assign by identified gap.

3 Assign As-Is or Adapt

Every program is ready to run without modification. If you know your student's schedule or constraints, the weekly structures adapt cleanly — you can compress, extend, or rotate session types without breaking the training logic.

4 Track Progress

Use the blank tracking template on Page 24 to log each session. Observable data — candidate quality, time per move, error patterns — is the only reliable guide for adjusting intensity mid-program.

- ❏ These programs work best when run during a student's active playing season, not during long breaks — mental training compounds fastest when paired with live game pressure.

Bonus 3 of 5 — Chess Coach Ready™ / Calculation & Mental Endurance Vault™

4-Week Calculation Speed Program

Beginner / Intermediate — Week 1 & 2

Program Overview

Duration: 4 Weeks

Target Level: Beginner to Intermediate (Rated 600–1400)

Sessions per Week: 3

Session Length: 45–60 minutes

Primary Goal: Build accurate, time-conscious candidate-move selection from a short list of forcing moves, developing the habit of looking before calculating deeply.

What Students Develop

- The habit of identifying forcing moves (checks, captures, threats) before general candidate selection
- Accurate short-line calculation (2–3 moves deep) under mild time pressure
- Basic board vision — tracking piece activity and opponent replies simultaneously
- Self-monitoring: recognizing when they have calculated versus when they have assumed

Week	Theme	Session Focus	Time Pressure
1	Candidate Identification	Find all forcing moves before calculating any	None — accuracy first
1	2-Move Calculation	Calculate to completion — no guessing at move 2	90 sec per position
1	Review + Verbalize	Student narrates their calculation tree aloud	No clock
2	3-Move Calculation	Extend tree depth by one ply — track errors at depth 3	2 min per position
2	Pattern Library	10 tactical motifs — identify without calculating first	30 sec per position
2	Mixed Drill	Alternating 2-move and 3-move positions, timed	90 sec / 2 min

4-Week Calculation Speed Program

Beginner / Intermediate — Week 3 & 4

Week	Theme	Session Focus	Time Pressure
3	Quiet Move Recognition	Identify non-forcing but decisive moves — the hardest calculation problem type at this level	3 min per position
3	Endgame Calculation	King and pawn endings — calculate to a definitive result, no guessing	2 min per position
3	Speed Bursts	20 simple 1-move puzzles at 15 seconds each — builds pattern reflex	15 sec per position
4	Full Calculation Sets	Sets of 10 mixed-depth positions (1–3 moves). Graded — student scores themselves honestly	Mixed: 30 sec–3 min
4	Game Analysis	Review one of the student's own games — identify moments they stopped calculating too early	No clock — reflection session
4	Final Assessment	20-position timed test. Coach records results against Week 1 baseline for measurable progress.	90 sec per position

Coach Note — Verbalization

In the first two weeks especially, require students to narrate their calculation aloud. This surfaces the exact moment they stop calculating and start guessing — which is the diagnostic you need to intervene at the right point.

Coach Note — Error Logging

Track *where* in the tree errors occur — at move 1 (wrong candidate), move 2 (missed reply), or move 3 (collapse of calculation). The depth of error predicts exactly what drill the next week needs to emphasize.

Beginner/Intermediate Program — Recommended Position Sources

Position Types by Week

Week 1: Single-theme tactical positions — pin, fork, skewer only. Use positions where the tactical motif is visible once all forcing moves are listed. No positions with multiple winning continuations.

Week 2: Double-theme positions where one motif sets up another. Student must see two moves ahead to identify why the first move works.

Position Difficulty Calibration

Week 3: Introduce "quiet move" positions and endgame calculation. These are harder at this level than tactical puzzles — manage the difficulty curve by starting with positions that have only one plausible non-forcing move to evaluate.

Week 4: Mixed positions that mirror real game complexity. The student should not know in advance what type of tactic — or whether there is one — before solving.

Minimum Positions Per Session

10–15 positions per session. Below 10, you don't generate enough repetition for pattern formation. Above 20 for a beginner, quality degrades sharply as fatigue sets in.

Solution Standard

Require the student to state the full move sequence — not just "Nf6 wins." Partial solutions are not scored as correct. This standard must be consistent from Day 1.

Reassessment Trigger

If the student scores below 50% on the Week 2 mixed drill, pause the program and return to single-theme Week 1 work for an additional week before advancing.

4-Week Calculation Speed Program

Advanced / Tournament — Week 1 & 2

Program Overview

Duration: 4 Weeks

Target Level: Advanced to Tournament (Rated 1400–2000+)

Sessions per Week: 3–4

Session Length: 60–90 minutes

Primary Goal: Develop deep, accurate calculation under game-realistic time pressure — 5-move-deep trees, accurate evaluation of sacrificial lines, and resistance to calculation fatigue in move 30+ positions.

Distinguishing Features vs. Beginner Program

- All positions involve at least 4-move calculation trees with meaningful branching
- Time pressure simulates real tournament clock conditions from Week 1
- Sacrificial motifs: the student must calculate beyond the material imbalance to confirm correctness
- Defensive calculation included — calculating the opponent's best responses, not just own moves
- Anti-calculation exercises: recognizing when NOT to calculate and instead evaluate positionally

Week	Theme	Session Focus	Time Pressure
1	Deep Tree Building	4-move calculation minimum. Map the tree completely before evaluating any branch.	5 min per position
1	Sacrificial Lines	Positions requiring material sacrifice — student must confirm the line fully, not assess by feeling	7 min per position
1	Speed Tactics Warm-Up	15 positions in 10 minutes — pattern recognition, not deep calculation. Separates known motifs from unknown ones.	40 sec per position
2	Defensive Calculation	Play the "opponent's role" — find the best defensive resource in a bad position	5 min per position
2	5-Move Trees	Extend to 5-ply. Track where the student's calculation collapses — depth 4 or 5?	8 min per position
2	Anti-Calculation	Mixed set: some positions are purely positional. Student must identify which require deep calculation and which don't.	3 min per position

Advanced Program — Week 3 & 4

Week	Theme	Session Focus	Time Pressure
3	Complex Endgame Calculation	Rook endings and pawn races — calculate to the exact result, not an approximate evaluation	8 min per position
3	Time Pressure Simulation	Positions solved with a real clock set to 90 seconds — mimicking severe time trouble decision-making	90 sec per position
3	Long Game Positions	Positions taken from move 30–40 of complex games — calculation in heavy fatigue zone	5 min per position
4	Full Simulation Sets	10 positions across all types (tactics, endgames, anti-calculation). Mixed depth, timed realistically.	Varies by position
4	Own Game Autopsy	Student identifies 3 moments in a recent game where deeper calculation would have changed the result	Unlimited — analysis session
4	Final Assessment	25-position timed test across all session types. Score against Week 1 baseline. Identify remaining error depth.	Mixed — 90 sec to 8 min

Coach Note — Error Depth Tracking

At this level, errors at depth 1 (wrong candidate) are red flags — the student may be playing on pattern rather than calculation. Errors at depth 4–5 are expected and productive. Distinguish between the two and adjust the program accordingly.

Coach Note — Sacrificial Accuracy

Many strong players accept unsound sacrifices because the position "looks winning." The solution is to enforce full calculation — the student must find the refutation themselves, not just accept the engine verdict after the session.

Advanced Program — Intensity Calibration Guide

The advanced program is designed to be demanding. Use this guide to calibrate intensity for your specific student without compromising the program's training effect.

If the Student is Excelling

Reduce time allowances by 20% in Weeks 3 and 4. Add a second speed tactics warm-up block to each session. Introduce multi-phase positions: tactics that transition into endgames requiring further calculation.

If the Student is Struggling

Do not reduce the position complexity — reduce the *number* of positions per session. Quality over quantity is the rule. 6 deeply worked positions beat 15 partially solved ones at every level.

Between-Week Adjustments

Review the session log at the end of each week. If error rate at depth 3 or below exceeds 40%, add one additional same-theme session before advancing to the next week's content.

The goal of this program is not comfort — it is calibrated discomfort. Students should finish each session having solved problems they were not sure they could solve. That is where the adaptation happens.

3-Week Visualization Foundations Program

Building the Ability to Hold a Position Without Moving Pieces

Program Overview

Duration: 3 Weeks

Target Level: Intermediate (Rated 900–1600)

Sessions per Week: 3

Session Length: 45 minutes

Primary Goal: Develop the student's ability to hold a static board position clearly in mind, track piece movement through a 2–3 move sequence without touching the pieces, and evaluate the resulting position accurately.

Why This Program Exists

Many intermediate players calculate "by moving pieces in their head" — but the image blurs after 1–2 moves. This program systematically builds the mental board as a stable, trustworthy workspace. It is a prerequisite for any meaningful blindfold work.

Start this program only after a student has completed at least one full calculation speed program, or demonstrates reliable 3-move calculation accuracy. Visualization without a solid calculation base produces guesswork, not skill.

Week	Theme	Exercise Description	Duration
1	Square-Color Drills	Student states piece locations and square colors without looking at the board after a 10-second study period	10 min
1	Single-Move Projection	From a set position, move one piece mentally and describe the result board verbally	15 min
1	Piece Path Tracing	Name every square a knight visits traveling from a1 to g5 without board access	10 min
2	2-Move Board Holding	Execute a 2-move sequence mentally; describe the board position after both moves	15 min
2	Diagram-Free Solving	Puzzle read aloud or given as text — student solves without seeing the board diagram	20 min
2	Position Recall	Study a position for 30 seconds, remove it, reconstruct from memory on a second board	10 min

Visualization Foundations — Week 3

Session	Exercise	Description	Duration
Session 7	3-Move Sequence Projection	Student executes a 3-move sequence mentally and describes the full result board — including all unchanged pieces	20 min
Session 7	Forced Line Visualization	Short forced tactical sequences (checks and captures only) — solve mentally without diagram access	15 min
Session 8	Silent Game Replay	Coach reads a 10-move game sequence move by move; student tracks the position mentally and answers questions about it	20 min
Session 8	Recall Under Interference	Study a position, answer an unrelated question, then reconstruct — trains board stability against distraction	15 min
Session 9	Mixed Visualization Test	All exercise types combined in a 40-minute session. Coach scores accuracy at each step: piece location, square color, post-move position, and evaluation.	40 min

Accuracy Standard

A piece in the wrong square — even by one square — is scored as incorrect. Precision, not approximation, is the training goal. Over time, the standard tightens the student's mental image automatically.

Verbal Articulation

Require the student to articulate the board in full: "The white rook is on d1, the black bishop is on g4." Vague statements like "the rook is on the d-file" are not accepted as correct during this program.

Progression Signal

A student is ready for the Blindfold Calculation Program when they complete the Week 3 mixed test at 80% accuracy or above consistently across two consecutive sessions.

Visualization Foundations — Common Failure Patterns

Every coach running this program will encounter predictable breakdowns at specific points. Knowing them in advance lets you intervene at the right moment rather than after damage is done.

The Moving Window Error

The student visualizes only the area around the active piece and loses track of the full board. Intervention: require the student to state *all* piece locations — not just the moved piece — after each mental move. This forces whole-board awareness.

The Evaluation Shortcut

The student correctly projects the position but then evaluates it by feeling rather than by counting or pattern-matching. Intervention: require a specific material count and king safety assessment before any evaluation is stated.

The Recall Collapse at Move 2

The student's mental board is accurate after move 1 but collapses at move 2 — the piece moved at move 1 "disappears" from the mental image. Intervention: return to single-move projection for two additional sessions before moving forward.

Premature Blindfold Pressure

Some students want to jump to blindfold games before the foundation is solid. This produces frustration and bad mental habits. Hold the line on the 80% accuracy gate before advancing to the blindfold program.

3-Week Blindfold Calculation Program

For Stronger Students — Progressive Blindfold Sequences

Program Overview

Duration: 3 Weeks

Target Level: Advanced (Rated 1600+)

Prerequisite: Visualization Foundations Program
(or equivalent demonstrated ability)

Sessions per Week: 3

Session Length: 60 minutes

Primary Goal: Calculate progressively longer forced and semi-forced lines entirely without board access, building the mental stamina to sustain a clear internal board image through complex position changes.

Structure Principle

This program progresses by increasing three distinct variables — one at a time — across the three weeks:

- **Week 1:** Increase sequence length (3 → 5 moves)
- **Week 2:** Increase position complexity (more pieces, more interaction)
- **Week 3:** Increase ambiguity (semi-forced lines where the student must evaluate multiple branches blindfolded)

Never increase two variables simultaneously. The compounding effect overwhelms mental load capacity and degrades both skills at once.

Week	Session	Blindfold Exercise	Length
1	1	3-move forced sequences (checks and captures only). Piece count ≤12. Narrate each move and piece state after it.	15 min
1	2	4-move forced sequences. Same position complexity. Student narrates and then reconstructs the final position on a board.	20 min
1	3	5-move forced sequences. Introduce one minor branching choice at move 3. Student must identify the branch and confirm continuation.	25 min

Blindfold Calculation Program — Weeks 2 & 3

Week	Session	Blindfold Exercise	Length
2	4	4-move sequences with full piece sets (16–20 pieces). Forced lines only. Student narrates every piece that moves AND every piece affected (discovered attacks, pin changes).	20 min
2	5	5-move sequences, full piece sets. One refutation check: student must verify their winning line is not refuted at move 4.	25 min
2	6	Mixed complexity session: 3 positions of increasing difficulty. Student self-rates board clarity 1–5 after each line and flags where the image blurred.	30 min
3	7	5-move semi-forced lines. Two candidate moves at move 1 — student must evaluate both blindfolded and select the better one with justification.	25 min
3	8	6-move sequences with semi-forced branches at moves 2 and 4. Full piece sets. Narrate and reconstruct final position.	30 min
3	9	Final assessment: 3 positions graded across accuracy (correct moves), completeness (full line stated), and board stability (image held to the end). Coach provides written feedback.	40 min

The Narration Protocol

The student must state each move as: "White knight from f3 to e5 — now on e5, attacking d7 and g4." This forces precise tracking and reveals board image quality in real time. Do not accept shorthand notation alone.

Board Reconstruction After Each Line

Reconstruction on a physical board after each blindfold sequence is not optional — it is the primary error-detection mechanism. A student who claims "I got it" but reconstructs incorrectly learned the wrong lesson.

Blindfold Program — Intensity Controls & Next Steps

If the Student Excels in Week 2

In Week 3, add a second 5-move position per session and remove the time buffer. Require evaluation of the final position (not just move accuracy) to add an extra cognitive layer without increasing move depth.

If Board Image Collapses at Move 4+

Return to Week 1 complexity (fewer pieces) but maintain the sequence length. The issue is position complexity, not move depth — don't reduce the number of moves, reduce the number of pieces active in the position.

After This Program

A student completing the Week 3 assessment at 70%+ accuracy is ready for informal blindfold games — not full game blindfold, but 10–15 move blindfold segments from a known starting position as a regular training tool.

Blindfold training is not a party trick — it is the clearest diagnostic tool you have for identifying exactly where a student's calculation breaks down. Every blur in the mental image is data.

3-Week Concentration Building Program

Sustained-Focus Training for Long-Game Endurance

Program Overview

Duration: 3 Weeks

Target Level: Intermediate to Advanced (Rated 1000–1800)

Sessions per Week: 3

Session Length: 60–75 minutes

Primary Goal: Build the student’s ability to sustain precise, high-quality decision-making across the full duration of a long game — particularly in moves 25–40 where cognitive fatigue is most likely to produce errors.

What This Program Trains

Concentration in chess is not passive attention — it is the ability to re-engage fully after interruptions (opponent’s move, clock pressure, position change) and maintain consistent analysis quality from move 1 to the final move.

- Sustained attention across long position analysis blocks
- Re-engagement speed after the opponent’s move
- Resistance to "auto-pilot" play — the most dangerous concentration failure mode
- Recognition of one’s own concentration drop and self-correction protocols

Week	Session Theme	Exercise Description	Duration
1	Sustained Analysis Blocks	Student analyzes a single complex position continuously for 20 minutes. No board moves, no engine — pure sustained analysis with verbal or written output every 5 minutes.	20 min block
1	Interruption Recovery	Coach interrupts mid-analysis with an unrelated question, then student must re-engage and continue from exactly where they were.	15 min
1	Attention Monitoring	Student rates their own focus quality 1–10 every 5 minutes during a long analysis block. Coach reviews the pattern afterward.	25 min

Concentration Program — Weeks 2 & 3

Week	Session Theme	Exercise Description	Duration
2	30-Minute Analysis Blocks	Extend sustained analysis to 30 continuous minutes. Written checkpoints every 10 minutes. Coach reviews quality degradation across checkpoints.	30 min block
2	Auto-Pilot Detection	Student plays a slow game against themselves. Coach stops them at random points: "What is your opponent's best response to what you just played?" Students frequently cannot answer — this is auto-pilot exposure.	25 min
2	Focus Reset Protocols	Practice 3 specific reset techniques when focus drops: board re-survey, piece activity re-count, clock re-evaluation. Student applies these at least twice per session voluntarily.	15 min practice
3	Full-Game Concentration Log	Student plays a game against any opponent and keeps a one-word focus journal (one word per move: "clear," "drifting," "sharp," "unsure"). Review with coach after.	Full game
3	Late-Game Analysis Emphasis	Position sets beginning at move 30. Student analyzes without context of the preceding game — trains entry concentration, not just sustained focus.	30 min
3	Concentration Debrief	Review the focus journal from Session 7 together. Identify the student's personal concentration timeline — at which move does quality drop? Build a personalized early-warning signal for tournament use.	20 min

Concentration Program — Coach Implementation Notes

Watch for Auto-Pilot Signs

Fast moves without clock pressure, failure to reconsider after the opponent's unexpected response, and moving to a predetermined plan without re-evaluating — these are the diagnostic markers of auto-pilot play. Flag them in real time, not after the game.

The Focus Journal Transfers to Games

The one-word focus journal is a tool for the training period, but the underlying habit — self-monitoring during play — transfers to tournament games permanently. Teach the student to run this internal check silently as a pre-move routine.

Don't Treat This as Psychology

These are chess training methods, not therapeutic interventions. Frame every exercise as a skill — concentration is a trainable board skill, not a personality trait. Students who believe they are "just not focused people" respond well to this reframe.

The most common coach error in concentration training: correcting the chess moves rather than the focus quality. In this program, the process of thinking is the training object — not the move selected. Keep feedback on the process.

3-Week Tournament Endurance Program

Focus, Fatigue Management & Composure in Multi-Round Events

Program Overview

Duration: 3 Weeks (run in the 3 weeks immediately preceding a multi-round event)

Target Level: Competitive players preparing for a rated tournament (any level)

Sessions per Week: 3–4

Session Length: 60–90 minutes

Primary Goal: Prepare the student to maintain strategic clarity, emotional composure, and full calculation quality across multiple consecutive rounds — including after poor results, long games, or fatigue from travel and scheduling.

Why Tournament Endurance Is Different

Tournament play introduces stressors that don't exist in training: accumulated fatigue across rounds, the psychological weight of a previous loss, unfamiliar opponents and playing conditions, and the pressure of public results. This program trains the student specifically for these conditions — not for a single-game peak, but for sustained multi-round performance.

Week	Focus	Session Theme	Duration
1	Physical Stamina Base	Two consecutive 45-minute slow games with a 10-minute break. Assess quality change between game 1 and game 2.	100 min total
1	Clock Management	Identify the student's personal time-trouble trigger point. Practice making high-quality decisions with 5 minutes or less on the clock.	45 min
1	Composure Baseline	Student plays a deliberately disadvantaged starting position. Coach assesses quality of resistance play under pressure from the opening.	45 min

Tournament Endurance Program — Weeks 2 & 3

Week	Focus	Session Theme	Duration
2	Post-Loss Recovery	After a deliberately bad game result, begin a new session immediately. Track whether calculation quality in session 2 is impacted by frustration from session 1.	90 min
2	Multi-Round Simulation	Three short rapid games in a row (15+10 each). No rest between rounds. Coach observes strategic consistency — does the student abandon their planned approach after one failure?	90 min
2	Between-Round Routine	Define and rehearse a 10-minute between-round routine: physical reset, brief position review, mental reset signal. Practice the routine formally — not just in theory.	20 min
3	Final Simulation Day	A full 4-round rapid tournament simulation in one session. Breaks are timed and structured identically to the upcoming event's schedule.	3–4 hours
3	Fatigue-State Calculation	30-minute calculation drill run <i>after</i> the simulation session, when the student is genuinely tired. This is the most important session in the program.	30 min
3	Pre-Event Debrief	Final session before the event. Reinforce between-round routine, identify two or three personal focus anchors the student can return to under pressure.	30 min

- ❑ The fatigue-state calculation session in Week 3 is frequently the student's lowest-scoring drill of the entire vault. Run it anyway — the data it provides is irreplaceable, and the experience of performing under genuine cognitive fatigue is exactly what tournament play demands.

Tournament Endurance — Pre-Event Protocol Summary

The week before a tournament is not the time for new training content. Use it for consolidation, routine reinforcement, and light sharpening only. This protocol applies in the final 7 days before any rated multi-round event.

The coaches who produce resilient tournament performers understand one thing above all: the day before the event is not a preparation day. It is a delivery day. The preparation is already done.

Matching the Student's Challenge to the Right Program

Every program in this vault targets a specific weakness profile. Use this guide to diagnose your student's primary gap and assign the correct program before designing any training schedule. Start here — not with level or rating.

Student Challenge	Primary Symptom	Assign This Program First	Then Consider
Slow Calculation	Spends 5+ minutes on simple tactical positions; misses time in games not from complexity but from speed	4-Week Calculation Speed Program (level-matched)	Concentration Building Program
Inaccurate Calculation	Fast but wrong — misses opponent replies at depth 2–3	4-Week Calculation Speed Program (start at Week 1 regardless of level)	Visualization Foundations Program
Poor Visualization	Cannot describe a position after two moves without moving pieces; calculation collapses after depth 2	Visualization Foundations Program	Blindfold Calculation Program
Loses Focus Late in Games	Strong in moves 1–25, deteriorates sharply in moves 30+; auto-pilot errors increase in the endgame approach	Concentration Building Program	Tournament Endurance Program
Tournament Nerves / Round Fatigue	Plays well in practice but deteriorates after round 2–3 in events; loses composure after a loss	Tournament Endurance Program	Concentration Building Program
Calculation Anxiety	Avoids calculating deeply — relies on positional "feel" because deep calculation feels unreliable or overwhelming	Visualization Foundations Program	4-Week Calculation Speed Program (Beginner/Intermediate)

Program Sequencing — Multi-Program Plans

Some students need more than one program run sequentially. Use these recommended sequences when a student's profile shows multiple overlapping weaknesses.

Student Progress Tracking Template

Printable / Fillable — For Any Vault Program

Use this template to log a student's progress through any program in this vault. Complete one row per session. Review the full log at the end of each week to identify trends before advancing to the next week's content.

Sessi on #	Date	Prog ram / Wee k	Exer cise Type	Posit ions Atte mpte d	Posit ions Corr ect	Erro r Patte rn Obse rved	Time per Posit ion (avg)	Focu s Qual ity (1– 10)	Coac h Note s / Adju stme nts
1									
2									
3									
4									
5									
6									
7									
8									
9									
10									
11									
12									

Weekly Summary Fields

At the end of each week, note: overall accuracy trend (improving / plateauing / declining), primary error type (depth, candidate selection, board image, evaluation), and the single most important adjustment for next week. One sentence per field is sufficient.

What You Now Have

6 Complete Programs

Two calculation speed programs, two visualization and blindfold programs, and two mental endurance programs — all ready to assign without additional design work.

Diagnostic Tools

A program selection guide, failure-pattern breakdowns, and calibration protocols so you assign the right program and adjust it correctly mid-run.

Tracking Infrastructure

A session-by-session progress template that generates the data you need to make meaningful mid-program adjustments and measure genuine progress over time.

These programs are the operational layer for Module 4 — *Calculation, Focus & Mental Preparation™*. Module 4 gives you the principles and the single-session blueprints. This vault gives you the multi-week arcs that transform those principles into durable student skills.

The compounding effect of consistent mental training alongside technical work is real and measurable — and it is underused by most coaches at every level. Students who complete even one program in this vault with genuine attention and honest tracking will feel the difference in their games within weeks. Students who cycle through multiple programs across a full season will develop a mental game that outlasts any opening preparation or tactical pattern set they accumulate.

Technical skill gets a student to the position they want. Mental endurance decides what they do when they get there.
