

CHESS COACH READY™

**Openings & Endgame Technique
Library™**

A full collection of structured opening repertoires and endgame technique, ready to integrate.

Welcome to Module 3

This module solves three of the most persistent problems in chess coaching: students who memorize random opening lines without understanding, endgame technique taught only when it accidentally appears in a game, and no clear phase-by-phase roadmap tying it all together.

What You'll Have

A complete, ready-to-teach opening repertoire library organized by color, plus a structured endgame technique sequence organized by piece type.

What You'll Eliminate

Improvised endgame lessons, inconsistent repertoire guidance, and the guesswork of knowing what to teach next.

Who It's For

Coaches at any level — whether your students are absolute beginners or approaching tournament competition.

*Module 3: Openings & Endgame Technique Library***™** / *Chess Coach Ready***™**

How to Use This Library

This module is built on two organizing logics: **repertoire by color** (White, Black vs. 1.e4, Black vs. 1.d4) and **endgame technique by piece type** (King & Pawn → Rook → Minor Pieces → Transitions). Work through each axis independently, then integrate using the session templates in Section 5.

Combining with Modules 1 & 2

Module 1 (Complete Lesson Library) provides your session structures. Module 2 (Tactical & Calculation Progression System) feeds directly into opening traps and endgame calculation. Use all three in rotation — do not treat this module in isolation.

Sequencing Opening vs. Endgame Work

A practical rule: spend the first 60% of any training block on opening repertoire, the remaining 40% on endgame technique. Beginners should reach basic King & Pawn endgames within the first 8–10 sessions, regardless of repertoire progress.

Module 3: Openings & Endgame Technique Library™ | Chess Coach Ready™

Table of Contents

01

Section 1 — Cover & Introduction (Pages 1–4)

Cover page, welcome, how to use this library, table of contents.

03

Section 3 — Opening Repertoire Library (Pages 10–24)

White repertoire foundations, Black vs. 1.e4, Black vs. 1.d4 and other openings — each with staged teaching sequences.

05

Section 5 — Session Templates (Pages 39–42)

Ready-to-run 45-minute lesson plans and a 4-lesson integration mini-plan.

02

Section 2 — Repertoire & Endgame Philosophy (Pages 5–9)

Coherent repertoire philosophy, opening principles, endgame-first mindset, level calibration, and common teaching mistakes.

04

Section 4 — Endgame Technique Library (Pages 25–38)

King & Pawn endgames, Rook endgames, Minor piece endgames, and transition into the endgame.

06

Section 6 — Closing Resources (Pages 43–45)

Pre-lesson checklist, blank planning template, and module closing bridge.

Why Students Need a Coherent Repertoire

A student who has memorized fifteen different openings but understands none of them is more fragile than a student who knows two systems deeply. Memorized lines fail the moment the opponent deviates. Coherent repertoire doesn't.

Repertoire as a Framework

A repertoire gives students recurring pawn structures, familiar piece maneuvers, and predictable middlegame plans. It builds pattern recognition through repetition — the single most important mechanism in chess improvement.

The Coach's Role

Your job is not to teach your student your favorite opening. It is to assign a repertoire that matches their current level, their temperament, and the types of positions they will encounter most often in their rating bracket.

One Repertoire at a Time

Resist the urge to introduce alternatives before a student has a working command of their primary system. Depth before breadth — always.

Opening Principles Before Systems

Before teaching any specific opening, confirm that your student can apply the four foundational principles to any position. These principles are not abstract — test them with concrete positions at every lesson.

Development

Every move should develop a new piece in the opening. Reinforce this by asking: "Which piece do you need to bring out most right now?"

King Safety

The king must reach safety — typically via short castling — before launching any flank or tactical operations. Non-negotiable at all levels.

Center Control

Control of e4, d4, e5, and d5 is the opening's strategic objective. Teach students to count who controls the center, not just who occupies it.

Pawn Structure Awareness

Students must understand that pawn moves are permanent. Introduce pawn structure vocabulary (isolated pawn, doubled pawn, passed pawn) before system-specific content.

Teach Endgame Technique Early and Often

The most common structural mistake in chess coaching is treating endgames as advanced material. In reality, King & Pawn endgames are the clearest arena for teaching calculation, king activation, and piece coordination — skills that transfer directly to every phase of the game.

Endgame technique is not a reward for advanced students. It is the foundation on which all other chess skills are built more clearly.

→ Start in Session 8–10

Introduce opposition and the concept of key squares in King & Pawn endgames within the first 8–10 sessions for any new student, regardless of level.

→ Revisit at Every Level Jump

Each time a student moves from Beginner to Intermediate or Intermediate to Advanced, revisit endgame technique at greater depth. The positions are the same — the calculation required deepens.

→ Connect Endgames to Games

After every analyzed game, ask: "If all the pieces came off the board right now, who would be winning?" This habit builds endgame intuition automatically.

Calibrating Depth by Student Level

These level definitions are used consistently throughout this module. Apply them precisely — the teaching sequence, the depth of repertoire, and the endgame complexity all depend on an accurate level assessment.

		
Beginner Unrated to approximately 800. Knows the rules and basic checkmates. Opening focus: principle-based play only, no system theory. Endgame focus: King & Pawn fundamentals — opposition, key squares, rule of the square.	Intermediate Approximately 800–1400. Plays regularly, understands basic tactics. Opening focus: one complete system per color, standard move orders, typical middlegame plans. Endgame focus: Philidor position, Lucena, same-color bishop endgames.	Advanced / Tournament Approximately 1400+. Competes regularly. Opening focus: complete repertoire with transpositions, anti-systems, and rare lines. Endgame focus: precision calculation, opposite-color bishops, knight endgame subtleties, transition evaluation.

Common Teaching Mistakes — and How This Library Prevents Them

1 Over-Teaching Theory Too Early

Presenting 15 moves of forced theory to a student who hasn't internalized pawn structure produces memorization without comprehension. This library sequences theory only after principle-based play is solid.

2 Ignoring Phase Transitions

Teaching openings and endgames as separate subjects with no bridge creates students who play well in known positions and poorly in unfamiliar ones. Section 4's transition module closes this gap explicitly.

3 Treating Endgames as an Afterthought

Coaches who say "we'll get to endgames later" routinely never do — or do so inconsistently. This module builds endgame work into every training block from session 8 onward.

4 Teaching Without a Student-Specific Repertoire

Assigning the same openings to every student regardless of style, level, or competitive context is a coaching shortcut. Use the planning template in Section 6 to build each student's individual repertoire profile.

White Repertoire Foundations

The White repertoire in this module is built around **1.e4** — the most instructive first move for developing spatial reasoning, open-file tactics, and direct attacking plans. The system is staged deliberately: students begin with principles, then receive system-specific guidance as comprehension deepens.

Module 3: Openings & Endgame Technique Library™ / Chess Coach Ready™

White: Core Ideas & Move Order Framework

The System at a Glance

1.e4 — control of d5 and f5, immediate central presence. After 1...e5, White follows with **2.Nf3** (attacking the e5-pawn, developing with tempo) and **3.Bc4** or **3.Bb5** depending on student level and Black's response.

- Beginner path: Italian Game (3.Bc4) — harmonious development, clear plans
- Intermediate path: Ruy López (3.Bb5) — pressure on the e5-pawn, strategic complexity

Plans for Both Sides

White's plans: Castle kingside quickly, develop Nc3 and d3/d4, build a central preponderance, target the f7 and e5 squares.

Black's typical responses: 3...Nf6 (counterattack), 3...Bc5 (symmetry), 3...a6 (Morphy Defense in the Ruy). Teach students each response conceptually before showing specific lines.

White: Teaching Stages — Beginner

BEGINNER

At the Beginner stage, the goal is **principle-adherent play from move 1**. Do not introduce named opening systems yet — focus entirely on principle application within the Italian Game structure.

01

Stage 1: Center First

Teach 1.e4 as the principled first move. Reinforce that e4 controls two center squares and opens lines for the queen and bishop. Have students play 10 games with this rule: move 1 is always 1.e4, no exceptions.

02

Stage 2: Develop with Purpose

After 1.e4 e5, teach 2.Nf3 (develops, attacks). Then 3.Bc4 (develops, eyes f7). Students should be able to explain why each move before making it.

03

Stage 3: Castle Before Attacking

Drill the habit of castling by move 6–7 in any Italian Game position. Use positions where premature attacks led to disaster as teaching examples.

04

Stage 4: Recognize Black's Traps

Introduce the Fried Liver Attack danger (Nc3-Ng5 premature), the Légal Trap concept, and how to avoid walking into known traps via principled play rather than memorization.

White: Teaching Stages — Intermediate

INTERMEDIATE

Intermediate students transition from the Italian Game into the **Ruy López**. This is not a downgrade of the Italian — it is a deepening of pressure and strategic complexity that rewards pattern-heavy study.

Ruy López: 3.Bb5

White pins the Nc6 (the defender of e5), establishing indirect pressure on the center. Teach students that 3.Bb5 is a strategic threat, not an immediate tactic. The bishop may retreat — the pressure remains.

Main Lines to Know

After 3...a6 (Morphy Defense): 4.Ba4 Nf6 5.0-0 — White castles and prepares the central break. After 5...Be7 6.Re1: teach the Closed Ruy — a positional battleground for Intermediate students.

Middlegame Plans

White's plan: d4 central break after preparation (c3, Re1, Nbd2). Black's plan: counterplay via d5 or f5. Teach both sides — students who understand what they're preventing play the opening better.

Common Traps to Avoid

The Noah's Ark Trap (b5-b4-b3 pawn trap on the light-squared bishop) is the most common Ruy López trap beginners fall into as White. Demonstrate it, then show the prevention: Ba4-Bb3 before Black organizes b5.

White vs. Non-1...e5 Responses

Students must have prepared responses to Black's alternatives to 1...e5 — otherwise every deviation becomes a crisis. Teach these as extensions of principle, not separate memorized systems.

vs. 1...c5 (Sicilian)

Recommend the Alapin Variation (2.c3) for Beginners and Intermediates. White prepares d4 without entering the main Sicilian theory maze. Simple, principled, and effective below 1600.

vs. 1...e6 (French)

Recommend the Exchange Variation (2.d4 d5 3.exd5 exd5) for Beginners — symmetrical, open, easy to understand. Intermediate students can learn the Advance Variation (3.e5) and its space-based strategy.

vs. 1...c6 (Caro-Kann)

Recommend 2.d4 d5 3.Nc3 — the Classical Variation. Straightforward development, slight space advantage. Teach that Black's goal is a solid structure and a later counterattack via ...c5.

vs. 1...d6 / 1...g6 (Pirc/Modern)

Recommend the Austrian Attack (2.d4 Nf6 3.Nc3 g6 4.f4) for Intermediate+ students seeking active play. For Beginners: simply develop normally and occupy the center.

Black Repertoire vs. 1.e4

Black's response to 1.e4 is the most tested ground in chess. The system recommended here balances fighting spirit with structural clarity: the **Sicilian Defense** (main recommendation for Intermediate and Advanced students) and the **e5 symmetrical approach** for Beginners — specifically the Two Knights or Italian structure from Black's perspective.

Module 3: Openings & Endgame Technique Library™ / Chess Coach Ready™

Black vs. 1.e4: Core Ideas & Beginner Path

BEGINNER

Beginners playing Black against 1.e4 should play **1...e5**. This creates immediate symmetry, opens lines for bishops and queen, and gives students familiar pawn structures from both sides of the board.

01

1...e5 — Stake the Center

Establish an equal central presence immediately. Teach students that this is a declaration: "I contest the center equally." Reinforce why giving up the center with 1...e6 or 1...d6 is a concession at this level.

03

3...Bc5 — Enter the Italian from Black's Side

After 3.Bc4, the mirror response 3...Bc5 (Giuoco Piano) is ideal for Beginners. Symmetric structure, clear plans, and both students learning the same pawn structure simultaneously — an efficient coaching double.

02

2...Nc6 — Defend and Develop

After 2.Nf3, Black plays 2...Nc6 — defending the e5-pawn while developing the best piece. Teach the double function of every move in the opening.

04

Castle and Coordinate

Black's plan: develop Nf6, castle kingside, prepare d6 or d5 depending on White's structure. Drill castling before move 7 as a non-negotiable habit.

Black vs. 1.e4: Intermediate Path — The Sicilian

INTERMEDIATE

At the Intermediate level, transition Black to the **Sicilian Defense (1...c5)**. The recommended system is the **Kan / Taimanov complex** (1.e4 c5 2.Nf3 e6) — flexible, structurally rich, and avoids massive theory traps.

Why the Kan/Taimanov?

It avoids the sharpest Anti-Sicilian lines, handles the Open Sicilian without memorizing the Najdorf or Dragon, and gives students a queenside pawn majority and central flexibility. It is the most teachable Sicilian system at the Intermediate level.

Core Move Order

1.e4 c5 2.Nf3 e6 3.d4 cxd4 4.Nxd4 a6 (Kan) or Nc6 (Taimanov). Black's plan: queenside expansion with ...b5, central break with ...d5, and piece activity via ...Bb7 and ...Qc7.

Middlegame Plan A

Queenside expansion: ...b5-b4, attacking White's queenside and gaining space. This is Black's main trump when White castles kingside.

Middlegame Plan B

Central break: ...d5. If White overextends, Black strikes in the center with ...d5, often equalizing or seizing the initiative.

Common Mistake to Prevent

Playing ...d6 too early and blocking the Bc8. The c8-bishop needs the e6-f5 diagonal or the a6-f1 diagonal via ...b5-Bb7. Teach the bishop's ideal deployment first.

Black vs. Anti-Sicilian Lines

Students playing the Sicilian will face Anti-Sicilian systems regularly — these are not rare deviations but common attempts to avoid theory. Prepare them specifically.

vs. 2.c3 (Alapin)

Black responds with 2...d5 (striking the center immediately) or 2...Nf6 (developing with counterattack). Teach: White's plan is 3.e5 followed by d4. Black should prevent this or meet it with active counterplay.

vs. 2.Nc3 (Grand Prix / Closed)

Black plays 2...Nc6 followed by g6 and Bg7 — the Accelerated Dragon setup. Key teaching point: don't rush ...d5 without preparation. Fianchetto the king's bishop first.

vs. 2.b3 / 2.f4 (Others)

Against unusual setups, apply principle: develop quickly, contest the center with ...d5 or ...e5, and castle before counterattacking. Students who know principles navigate any deviation.

- ❏ Coaching cue: Show students one Anti-Sicilian line per session until they feel comfortable. Over-preparing for rare lines is as damaging as under-preparing.

Black vs. 1.e4: Common Traps & Teaching Notes

The Elephant Trap (Queen's Gambit Adjacent)

While primarily a d4 defense trap, show students the principle: traps arise when the opponent moves a piece twice in the opening to capture a pawn, falling behind in development. Pattern recognition over memorization.

Scholar's Mate Defense

Every Beginner must know how to refute 4.Qh5 (Scholar's Mate attempt): 3...Nc6 covers e5; then if 4.Qh5, 4...g6 forces the queen back. Drill this as a one-time inoculation, then move on.

Knight Fork Awareness

Teach students to see Nd5 fork threats (hitting c7 and e7 simultaneously) in Sicilian positions. This is the single most common tactical motif Black must watch for in the opening phase.

Black Repertoire vs. 1.d4 and Other Openings

Black's response to 1.d4 requires a different strategic mindset than 1.e4 defenses. The center is typically contested from a distance, pawn structures are more complex, and middlegame plans develop more slowly. The recommended system is the **King's Indian Defense (KID)** for students seeking dynamic play, with the **Nimzo-Indian / Queen's Indian** complex as the alternative for positionally-oriented students.

US

Black vs. 1.d4: King's Indian Defense

INTERMEDIATE

ADVANCED

The KID (1.d4 Nf6 2.c4 g6 3.Nc3 Bg7 4.e4 d6 5.Nf3 0-0) is one of the most fighting, richest structures in chess. Teach it as a philosophy: Black allows White to build a large center, then attacks it.

01

Allow the Center

Black deliberately lets White occupy e4 and d4 with pawns. Teach students this is not weakness — it is a provocation. The KID bishop on g7 is a long-range weapon against that center.

03

Kingside Attack vs. Queenside Attack

The KID is a race: White attacks queenside (b4, c5, Qb3), Black attacks kingside (f5, Ng4, h5). Teach students to identify which plan is more advanced and how to respond to White's queenside breakthroughs.

02

Castle and Prepare the Break

After castling, Black's central break is ...e5 (Classic Variation) or ...c5 (Modern Benoni adjacent). Teach the typical plan: ...e5, knight to e8, f5 push — the "KID Attack."

04

Key Variation: Classical Main Line

5.Nf3 0-0 6.Be2 e5 7.0-0 Nc6 8.d5 Ne7 — the most important position in the KID. Teach students the pawn structure, the closed center, and both sides' characteristic plans before moving to minor variations.

Black vs. 1.d4: Nimzo-Indian & Queen's Indian

INTERMEDIATE

ADVANCED

For positionally-oriented students who prefer structural clarity over kingside attacks, the **Nimzo-Indian (1.d4 Nf6 2.c4 e6 3.Nc3 Bb4)** and **Queen's Indian (3.Nf3 b6)** are the recommended alternatives.

Nimzo-Indian: Core Idea

Black immediately pins the Nc3 with 3...Bb4, preventing e4 and creating structural imbalance. White must decide: accept doubled pawns (4.Qc2 or 4.a3) or keep the knight. Black's plan: ...d5 or ...e5 central breaks, bishop pair advantage for White, structural advantage for Black.

Queen's Indian: Core Idea

When White plays 3.Nf3 (avoiding the Nimzo), Black responds 3...b6, fianchettoing the queenside bishop. The Bb7 controls the long diagonal and contests e4. Typical plan: ...Bb7, ...Be7 or ...Bb4+, ...0-0, ...d5.

Teaching the Nimzo First

Teach the Nimzo before the Queen's Indian — it introduces the concept of piece activity over material, which transfers to every phase of the game.

The Rubinstein System

4.e3 — the most solid White response. Black plays 4...0-0, 5...d5, developing solidly and aiming for ...c5 to challenge the center.

Common Student Error

Releasing the bishop pair too quickly without compensation. Teach students: the Bb4 is captured only when the resulting pawn structure justifies the trade.

Black vs. 1.c4, 1.Nf3, and Other First Moves

Students will encounter these first moves regularly, especially in club and tournament play. Prepare a principled, consistent response that doesn't require learning new pawn structures.

vs. 1.c4 (English Opening)

Recommend a KID setup: 1...Nf6, 2...g6, 3...Bg7, 4...0-0 — students already know the pawn structure, the plans, and the piece coordination. No new theory required.

vs. 1.Nf3

Recommend 1...d5 (Queen's Gambit declined setup) or 1...Nf6 with a KID/Nimzo setup. Key coaching point: 1.Nf3 often transposes into standard d4 structures — students need not memorize it separately.

vs. 1.b3, 1.f4, Others

Principle over memory: develop quickly, occupy the center with ...d5 and ...e5, castle early. Students who have internalized the four opening principles need only minimal preparation for these flank systems.

Opening Repertoire: Summary Roadmap

This roadmap shows how every recommended system fits within a single coherent framework. Students move through it progressively — no backtracking, no redundant learning.

King & Pawn Endgames

King and Pawn endgames are the bedrock of endgame technique. Every other endgame type eventually reduces to K+P principles. Master this section before moving to any other endgame category — for both you and your students.

Module 3: Openings & Endgame Technique Library™ / Chess Coach Ready™

Opposition: The Foundational Concept

Opposition is the single most important King & Pawn concept. A student who understands direct opposition understands the mechanism behind every king vs. king struggle.

01

Define Direct Opposition

Two kings are in direct opposition when they face each other with exactly one square between them and it is the opponent's turn to move. The side to move must give ground. Demonstrate on an empty board before introducing pawns.

03

Introduce Distant Opposition

When kings are separated by three or five squares on the same file/rank/diagonal, the side without the move has the advantage. Practice exercises: given a position, ask students to count whether opposition is direct, distant, or diagonal.

02

Demonstrate the Zugzwang

Set up Ke5 vs. Ke7 with White to move: White must give up opposition. Then flip it — Black to move: Black must give ground. Students immediately see the power of having the move in the opponent's hands.

04

Apply with a Pawn

Add a single pawn for each side. Challenge: "Can the stronger side queen the pawn?" Opposition determines the answer. Run at least five different pawn positions before moving to key squares.

Key Squares & Breakthrough Technique

Key Squares Defined

A pawn on the 4th rank has key squares on the 6th rank — two squares diagonally ahead. If the attacking king reaches any key square, the pawn will queen regardless of where the defending king stands. Teach this before any specific K+P calculation.

Drill: Place a pawn on d4. Identify key squares (c6, d6, e6). Ask: "Can White's king reach any of these before Black's king can stop it?"

Breakthrough Technique

With three connected passed pawns vs. three, the breakthrough pawn sacrifice wins by force. Teach the classic setup: pawns on a5-b5-c5 vs. a7-b7-c7. The sacrifice b5-b6 (or a5-a6 or c5-c6) creates an unstoppable passer.

Common student error: Calculating only one pawn break possibility. Teach systematic evaluation: check all three breakthrough candidates before committing.

Walk through each concept in sequence — opposition before key squares, key squares before breakthrough. Students who skip opposition struggle to understand why breakthrough timing matters.

The Rule of the Square

The rule of the square is the fastest method for determining whether a lone king can catch a passed pawn without detailed move-by-move calculation. Every student at every level must know this technique cold.

1 Draw the Square

From the pawn's current square, draw an imaginary square extending to the queening square. The square's side length equals the number of squares the pawn must travel. If the defending king stands inside (or can step inside on its move), it catches the pawn.

2 Apply the "Step Inside" Test

With the defending side to move, the king only needs to step inside the square on its first move — not be inside it already. Drill this distinction with multiple positions until it becomes automatic.

3 Practice Exercise

Set up: White pawn on a5, Black king on h8, White king elsewhere. Ask students: "Can the Black king catch the pawn?" Then shift the pawn one square at a time to show how the square changes. Minimum eight positions per session.

- 📌 Coaching cue: Students who draw the square visually on the board outperform those who count moves abstractly. Encourage board visualization — trace the square with a finger if needed in early sessions.

K+P Endgame: Common Student Errors & Practice Exercises

Error 1: King Passivity

Students keep the king passive while trying to advance pawns. Drill: In any K+P endgame, ask the student to name the king's destination before calculating any pawn moves. King activation is step one, always.

Error 2: Wrong Opposition Calculation

Students confuse who has the opposition when multiple pawns are on the board.

Practice exercise: three different K+P positions per session, each asking "who has the opposition and why does it matter here?"

Error 3: Ignoring Stalemate

Attacking side pushes the pawn aggressively and walks into stalemate. Classic position: White King h6, Pawn h5, Black King h8 — 1.h6 is stalemate. Teach this position to every Beginner, then challenge Intermediates to find all stalemate resources for the defending side.

Weekly Drill Recommendation

Dedicate 10–12 minutes of every session to K+P endgame positions until the student solves five consecutive positions correctly without hints. Then reduce to a monthly check-in.

Rook Endgames

Rook endgames are the most common endgame type in practical play — statistically, more games end with rooks on the board than any other piece configuration. Students who understand rook endgame principles win more games and draw fewer they should win.

Module 3: Openings & Endgame Technique Library™ / Chess Coach Ready™

The Philidor Position: Defending the Draw

INTERMEDIATE

ADVANCED

The Philidor position is Black's drawing technique in Rook + King vs. Rook + Pawn + King endgames. It is mandatory knowledge for every student above the Beginner level.

01

The Setup

Classic position: White King d5, Rook d1, Pawn d6; Black King d8, Rook f6. Black's defensive technique begins with 1...Rf6! — placing the rook on the 6th rank, the "Philidor rank."

03

Transition to Checks

Once White's pawn reaches the 6th rank and pushes to the 7th, Black's rook shifts to the 1st rank and begins harassing the White king with checks from behind. The king cannot escape the checks without abandoning the pawn.

02

Principle: Rook on the 6th Rank

As long as the pawn has not yet crossed the 6th rank, Black keeps the rook on the 6th rank. This cuts off the White king and prevents the pawn from advancing without losing material.

04

Student Drill

Set up the Philidor position. Have the student play Black from five different king/pawn configurations. Grade: did they hold the draw? If not, which move was the mistake?

The Lucena Position: Winning the Won Game

INTERMEDIATE

ADVANCED

If the Philidor is how to draw, the Lucena position is how to win. Students who know the "bridge-building" technique will convert Rook + Pawn endgames reliably.

The Position

Classic Lucena: White King on d7 (in front of its pawn on d6), White Rook on a1, Black King cut off on the f-file, Black Rook passive. White must "build a bridge" to shelter its king from Black's rook checks.

The Bridge-Building Technique

Step 1: 1.Re4 (rook goes to the 4th rank). Step 2: Push the pawn to d7. Step 3: Black checks from behind — 2...Rd1 check. Step 4: White interposes the rook (3.Re1) to block the check. Step 5: The bridge is built; the pawn queens.

Common Mistake

Pushing the pawn to d8=Q without building the bridge first, resulting in Black's rook checking the king indefinitely. Teach bridge-building first, queening second.

Rook File Variations

The bridge-building technique varies slightly with a-file or h-file pawns (rook's pawns). Teach the standard position first; introduce rook's pawn exceptions at the Advanced level.

Drill Assignment

Students should practice the Lucena position until they can execute the bridge-building technique without hints in under 10 moves from the standard starting position.

Active Rook Principles & Cutting Off the King

Rooks Belong on Open Files

In any endgame with a rook, the first priority is placing it on the most open file. Teach this as a reflex — before calculating pawn advances, ask: "Is my rook on the best file?"

Cut Off the King — By Rank

Cutting off the opposing king by rank (placing the rook on a rank that prevents the king from advancing) is often more powerful than chasing it. Demonstrate positions where a cut-off king is helpless even with a material advantage.

Rook Behind Passed Pawns

The rook belongs behind passed pawns — your own or the opponent's. Behind your passer, it pushes indefinitely. Behind the opponent's passer, it restrains indefinitely. This is one rule that applies equally to attack and defense.

King and Rook Coordination

In rook endgames, the king is a fighting piece. Teach students to activate the king aggressively once rooks have been exchanged or neutralized. Passive kings lose rook endgames that active kings would draw.

Minor Piece Endgames

Minor piece endgames are where positional understanding separates good students from great ones. The difference between a winning and a drawn position often hinges on which minor piece is better — and whether your student recognizes it in real time.

Module 3: Openings & Endgame Technique Library™ / Chess Coach Ready™

Bishop Endgames: Same-Color & Opposite-Color

Same-Color Bishops

When both sides have bishops on the same color, the stronger side aims to fix enemy pawns on squares the bishop can attack. The weaker side aims to place all pawns on the bishop's color (paradoxically — this blocks the bishop from operating freely).

Core principle: Place pawns on the opposite color of your bishop. Drill: given a same-color bishop endgame, ask students which pawn moves improve their bishop's activity.

Opposite-Color Bishops

Opposite-color bishop endgames are notoriously drawish — the defending side often holds even with two or three pawns down because the attacking bishop cannot attack the defending bishop's pawns.

Key exception: When the attacking side has connected passed pawns on both wings, the defending bishop cannot cover both threats simultaneously. Teach this as the primary winning technique in OC bishop endgames.

Beginner Drill

Same-color bishop vs. bishop: Who is winning? Have students identify which pawns are fixed and on what color. If they can answer this, they understand the endgame.

Intermediate Drill

Opposite-color bishop with three-pawn advantage for one side. Challenge: can the stronger side win? Walk through the drawing technique (king centralization, bishop blockade) step by step.

Common Student Error

Believing that a material advantage automatically wins any bishop endgame. Correct this misconception with two or three practical positions where the stronger side cannot win despite extra pawns.

Knight Endgame Principles

Knights are short-range pieces — they require the king's support more than any other piece in the endgame. Students who treat the knight as an independent attacking piece in endgames consistently make losing moves.

1 Centralize the Knight Always

A knight on the rim is dim — this maxim applies doubly in the endgame. Demonstrate positions where a rim knight is effectively paralyzed while a centralized knight controls eight squares and dominates the position.

2 Knight vs. Bishop: Know When Each Wins

Knight is better when: pawns are on both sides, position is closed, the knight has strong outposts. Bishop is better when: position is open, pawns are passed and far apart, king activity is required on both wings simultaneously.

3 Knight Outpost — The Dominant Concept

A knight planted on a central or advanced outpost (a square that cannot be attacked by an enemy pawn) often decides knight endgames. Teach students to identify and create outposts before calculating knight maneuvers.

4 Knight & King Cooperation

The king must escort the knight to its outpost. Practice: place a knight on a1, king on e8. Ask the student to maneuver both pieces to optimal squares while White attempts to disrupt. This drill improves coordination thinking across all endgame types.

Transition Into the Endgame

Knowing how to play endgames is only half the skill. Knowing when to enter one — and which one to steer toward — is what separates tournament players from club players. Teach this as a decision framework, not a set of positions.

01	02	03
Recognize When to Simplify	Evaluate Which Endgame Is Favorable	Steer Toward Your Best Endgame Type
Simplify when: you have a material advantage and an endgame is technically winning, your pieces are more active than your opponent's, or your pawn structure is better suited to an endgame than a middlegame.	Before trading pieces, ask: "If I trade all rooks and minor pieces, what do I get?" Students must be able to evaluate the resulting K+P position before committing to simplification. Drill this habit until it is automatic.	If your student's bishop is better, trade knights and keep bishops. If your rook is more active, keep rooks and trade minor pieces. Teach students to actively engineer the endgame type they want, not to passively accept whatever appears.

Converting an Advantage: The Final Step

Having a winning position and converting it are two separate skills. Students frequently understand that they are better but lack a systematic method for reducing the game to a technical win.

The Two-Step Framework

Step 1: Identify your winning asset (passed pawn, dominant king, superior piece). Step 2: Improve that asset or use it to create a second weakness. A winning endgame is almost always about creating two threats, not one.

The "Two Weaknesses" Principle

One weakness can often be defended. Two weaknesses on opposite wings cannot be. Teach students to identify the first weakness, then use it to provoke and fix a second weakness before attacking either directly.

Patience Over Speed

Students in winning positions often rush and allow unnecessary counterplay. Teach: there is no time limit in a technical win. Improve the position maximally before making the decisive thrust. This is a mindset shift, not a calculation skill.

Practice Framework

Present students with a technically winning endgame position and ask: "What is your plan for the next ten moves?" Evaluate the quality of their plan before they execute it. Adjust before errors occur.

45-Minute Repertoire Building Lesson Template

This template is ready to run as-is. Copy it directly into your lesson plan. Adapt timings by no more than ± 5 minutes per block.

0–5 min: Opening Check

Ask the student to play out their repertoire from move 1 to move 8 from memory — both colors if applicable. Note any deviations from the prescribed system.

1

2

5–20 min: Position Review

Present three middlegame positions arising from the student's repertoire. Ask: "What is the plan here?" Correct without criticizing — affirm correct ideas, redirect incorrect ones with a question ("What would happen if...?").

20–35 min: New Variation or Problem Line

Introduce one new variation, anti-system response, or common deviation. Walk through the idea, typical plans, and the student's recommended response. Play the variation out from both sides.

3

4

35–45 min: Practice Game Excerpt

Play a 10-move "opening game" from the new starting position. Student plays their color; coach plays the opponent. After 10 moves, evaluate together: did the student achieve the typical middlegame structure?

45-Minute Endgame Technique Lesson Template

This template covers one endgame concept per session — resist the urge to cover two. Depth and repetition outperform coverage and variety in endgame training.

0–8 min: Warm-Up Review

Revisit the previous session's endgame concept with one or two fresh positions. No hints — student solves independently. This builds long-term retention and reveals gaps before new material is introduced.

8–20 min: Concept Introduction

Introduce the new concept (e.g., Philidor position, bridge-building, key squares). Use the exact position from this library as the teaching position. Explain the principle, demonstrate the technique, play through the solution together.

20–35 min: Guided Practice

Student plays four to five positions based on the new concept. Coach observes and asks questions ("What is your king's destination?" "Have you checked for stalemate?") without giving direct solutions unless the student is completely stuck.

35–45 min: Independent Solving

Two positions — student solves alone with no coaching intervention. Coach records which positions were solved correctly and which required multiple attempts. This data informs the next session's warm-up.

4-Lesson Integration Mini-Plan: Sessions 1–2

REPERTOIRE & ENDGAME INTEGRATION

This mini-plan shows how to alternate opening and endgame work across a four-lesson training block. Run this plan during any four-session period in a student's training cycle.

Session 1: Repertoire Focus

Opening block (30 min): Review and extend the student's White repertoire — one new variation or one problematic deviation addressed.

Endgame bridge (15 min): Warm-up only — two K+P positions from the previous endgame session. No new endgame content. Purpose: maintain retention while keeping the session's focus on repertoire.

Coaching note: Assign one practice game for homework with the instruction: "Play the opening as coached. After the game, identify the exact move where you left your repertoire."

Session 2: Endgame Focus

Endgame block (30 min): Full endgame session — introduce one new endgame concept following the Endgame Technique Lesson Template. This session's concept should connect to a pawn structure arising from the student's opening repertoire if possible.

Opening bridge (15 min): Student plays their repertoire to move 6 from memory. Correct any errors. No new opening content. Purpose: maintain opening fluency without competing with the endgame learning focus.

Coaching note: After the session, ask: "Where in a game with your repertoire might this endgame type arise?" Connecting the two phases builds integrated chess thinking.

4-Lesson Integration Mini-Plan: Sessions 3–4

REPERTOIRE & ENDGAME INTEGRATION

Session 3: Full Integration Game

Game play (25 min): Student plays a practice game against the coach. Coach plays principled but improvised responses — not a rehearsed system. The student must navigate with their repertoire as the only preparation.

Post-game analysis (20 min): Analyze together, focusing on three questions: (1) Did the student achieve the correct opening structure? (2) Was the transition from opening to middlegame principled? (3) If the game reached an endgame, was the technique sound?

Session 4: Assessment & Planning

Endgame test (15 min): Three endgame positions from this module, unseen. Student solves independently. Grade: 3/3 = ready for next endgame category. 2/3 = one additional session on current category. 1/3 or below = restart current category.

Repertoire test (15 min): Student plays out their entire repertoire from move 1 against coach's deviations. Evaluate fluency, not perfection.

Planning (15 min): Based on results, set the next four sessions' focus areas using the same mini-plan structure. Update the student's repertoire profile template.

- ❑ This four-session structure is repeatable indefinitely. Rotate the endgame category (K+P → Rook → Minor Pieces → Transition) and deepen the opening variation (add anti-systems, new lines) with each cycle.

Pre-Lesson Checklist: Before Teaching Any Opening or Endgame Lesson

Screenshot or print this checklist. Run through it before every session — it takes under two minutes and prevents the most common preparation errors.

- ☐ Confirmed the student's current level (Beginner / Intermediate / Advanced) and updated if level has changed since last assessment
- ☐ Selected one opening system or one endgame concept for this session — not multiple
- ☐ Identified the teaching position(s) from this module for today's concept
- ☐ Prepared warm-up review positions from the previous session's content
- ☐ Identified the common student error(s) most likely to appear today (per this module's error notes)
- ☐ Connected today's endgame content to a pawn structure arising from the student's opening repertoire (if possible)
- ☐ Set a clear learning objective: "By the end of this session, the student should be able to ____"
- ☐ Prepared at least two independent-solving positions for the session's closing block
- ☐ Prepared homework assignment (one practice game, one endgame position to solve, or one variation to play out)
- ☐ Updated the student's repertoire profile template with any new variations or endgame concepts introduced

Blank Repertoire Planning Template

Complete this template for each student. Update it after every level assessment and whenever a new opening system or endgame category is introduced.

Field	Current Assignment	Next Step	Notes
Student Name			
Current Level	Beginner / Intermediate / Advanced	Last assessed:	
White Repertoire	Italian Game / Ruy López / Other	Anti-system coverage:	
Black vs. 1.e4	1...e5 / Sicilian Kan / Other		
Black vs. 1.d4	KID / Nimzo / QID / Other		
Black vs. 1.c4/1.Nf3	KID setup / Other		
Current Endgame Category	K+P / Rook / Minor / Transition		
Endgame Concepts Mastered			
Endgame Concepts In Progress			
Key Weakness to Address			
Next Session Focus	Opening / Endgame / Integration		
Homework Assigned			Due:

Module 3 Complete

Module 3 of the Chess Coach Ready™ system has given you a complete, structured, ready-to-teach library — covering opening repertoire for both colors, endgame technique from King & Pawn fundamentals through rook and minor piece precision, and the tools to integrate both phases into every training block you run.

What This Module Delivered

- A principle-based White repertoire (Italian → Ruy López) with staged teaching sequences
- Black systems vs. 1.e4 (1...e5 and Sicilian Kan/Taimanov) and vs. 1.d4 (KID and Nimzo-Indian)
- Complete endgame technique library: K+P, Rook (Philidor, Lucena), Minor Pieces, Transition
- Two 45-minute lesson templates and a 4-session integration mini-plan
- Pre-lesson checklist and blank repertoire planning template

What's Next: Module 4

Calculation, Focus & Mental

Preparation™ is the next module in the Chess Coach Ready™ system. It gives you a complete framework for training your students' calculation process, decision-making under time pressure, tournament psychology, and the mental habits that separate competitive players from casual ones.

Every opening and endgame technique in this module becomes more powerful when paired with the calculation skills in Module 4. That is where the system is designed to take you next.

The coach who teaches a student to play any position with principle and convert any endgame with technique has given them something no memorized line ever could: an understanding of chess that travels with them everywhere they play.
